

It is important for the Federal Communications Commission to understand that this device is likely to cause significant interference with Television and FM Radio Translators. And that the input as well as the output channels for Television and FM Radio translators stations be protected from interference by such a device. My advise would be to require input channel information for every Television and FM radio translator station be provided by that station licensee and that this information be posted on the CDBS engineering information page (or elsewhere) for use by the potential unlicensed user. These unlicensed devices should be registered (at a minimum) with the FCC and a contact person provide for use by the recipient of the interference. The unlicensed owner be issued a call sign (or something similar) for identification purposes. That the call be broadcast by the unlicensed device several times each day. And finally no mobile operation be allowed.
